

The White River Watershed (central Vermont): The White River Partnership's goal is to restore river corridors through collaborative public involvement, determining issues and desired future conditions, and restoration action. Restoration practices include: restoration of large woody debris, riparian management and buffer establishment; bioengineering to stabilize banks; livestock exclusion and alternate water sources; rock and log vanes; rock armoring (riprap) combined with bioengineering; and tree and rootwad revetment systems. The Partnership engages citizens and communities in watershed restoration efforts and education using public forums, field days; watershed education; and an Eco-Heritage tourism initiative.

The 12 restoration showcase watersheds were selected for their use of stream corridor restoration technology to improve the community, the environment, and water quality as endorsed in the Clean Water Action Plan. They represent a variety of geographic locations and conditions, a balance of management practice and technical design, strong local, tribal or state leadership, and partnership in stream corridor restoration.
